Current sequence finishing criteria for the C. elegans genome sequence finishing criteria for the C. elegans genome sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note.

In sequence It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

This sequence is the entire insert of clone T2LC9. The true right end of clone F3ZC8 is at 17256 in this sequence. The start of this sequence (1. 105) overlaps with the end of sequence 772509.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2.2 Mp of contiguous nucleotide sequence from chromosome III of C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Submitted (10-MAY-1996) Louis, MO 63110, USA. E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu coding sequences below are predicted from computer analysis, usin predictions from Genefinder (P. Green, U. Washington), and other available information.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene.chspene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (sea Eddy. Simple repeats are identified by repeatmasker (Arian Smit. http://ftp.genome.washington.edu/kW/RepeatMasker.html). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRAIL are anotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /protein_id="AAD23652.1"

BAC clone T22F11 is from Arabidopsis chromosome II and is near the
molecular marker GPA1.
                                                                                                                                                                                                                                                                      Direct Submission

Naratas, P., Heatoru, A., HORTON, L., HOWLENG, L., JODGE, Y., Macdonald, P., Maratas, A., Lehoczky, J., Lieu, C., Locke, K., Macdonald, P., Maratas, N., McEwan, P., McGurk, A., McKernan, K., McLaughlin, J., Mella, M., Morlis, W., Morlis, P., Mychalecky, J., Naloff, M., O'Connor, T., O'Donnell, P., Pevlin, B., Stanger Thomann, N., Stojanovic, N., Stone, C., Subramanian, A., Tesfaye, S., Torruella-Miller, I., Vassiliev, H., Vo, A., Wagner, A., Whan, D., Ye, W.J. and Zody, M.

Direct Submission

NL Submitted (27-Aug-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA on Sep 3, 1999 this sequence version replaced gi:5788096.

All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)

http://ftp.genome.washington.edu/RM/RepeatMasker: html.

* Nord: This record contains 113 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* arbitrary. Low-pass sequence sampling is useful for

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* voverlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will

* he preserved.

Sequence of the CD28 gene. S
Rhodosporidium toruloides D-
Enterococcus faecalis gene E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes 3 Staphylococcus aureus proteins of The present sequence encodes 3 Staphylococcus aureus protein, that, based on homology with a unknown function and a protein, is believed to be an autolysin staphylococcus aureus protein, is believed to be an autolysin (EC 3.5.1.28) (N-acetylmuramoyl-1-alanine amidase).

The present sequence was obtained from a library of clones of S. aureus WCHH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of requiatory elements for the control of bacterial gene expression. The encoded protein may be used control of bacterial and host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                 DNA encoding an autolysin and 3 unknown proteins. Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome; toxic shock syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           p-PSDB; W28340, W28341, W28342, W28343.
Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 to isolate autimicrobial compounds, and in vaccines against S. aureus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21-AUG-1997.

New nucleic acid sequences from Staphylococcus aureus WCHU29 -

1 useful in vaccines and for treatment of bacterial infections of e.g.

1 useful in vaccines and for treatment of bacterial infections of e.g.

2 useful in vaccines and for treatment of bacterial infections of e.g.

2 trespiratory tract and central nervous system

3 claim 1: Page 214-216; 390pp; English.

2 this sequence encodes 2 Staphylococcus aureus proteins of unknown

3 claim 1: Page 214-216; 390pp; English.

4 claim 2: Page 214-216; 390pp; English.

4 claim 3 conditions which may be treated include bacterial infections, especially crespiratory, cardiac, gastrointestinal, central nervous, eye, kidney, criminary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. Pylori infection.

Polynucleotide(s) and proteins derived from Staphylococcus aureus - Polynucleotide(s) and proteins derived from Staphylococcus aureus - Polynucleotide(s) and proteins derived from staphylococcus aureus Proteins anti-S.aureus vaccines

Parti-S.aureus vaccines

Protein anti-S.aureus presents one of 5191 Staphylococcus aureus DNA sequences

Claim 1: Page 271-277; 3271pp; English.

Claim 1: Page 271-277; 3271pp; English.

Commonyr (RAM), read-only memory (ROM) or CD-ROM, Homology searches using the saureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, evelld infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable medium.

Computer readable medium.

This nucleotide sequence Comprises novel human tumour rejection
antigen precursor (TRAP) MAGE-C1 cDNA (see also v69720). MAGE-C1
is a novel member of the MAGE family that may be recognised by
cytotoxic T cells, leading to lysis of the tumour cells which
express it. MACE-C1 and MACE-C2 (see W81546-47) are expressed in a
variety of tumours and in normal testis cells, but not by other
normal cells. The MAGE-C1 cDNA was isolated from a melanoma
LB373-MEL cDNA library using a probe generated from LB-373-MEL
RNA by PCR (see V69728-29). It shows homology to MAGE-A1 cDNA (see
V69719) and codes for a putative l072-amino acid protein. The
NACE-C1 gene was localised to chromosome region Xq26-q27. MACE-C1
and MACE-C2 cDNAS (see V69726) are claimed, as are: expression
vectors; transformed or transfected cell lines (e.g. cOS and CHO);
an isolated TRAP encoded by the cDNAs; a kit useful in a PCR based
assay comprising an oligonucleotide having a sequence of
nucleotides 18-34 of the 4031 by mACE-C1 cDNA and an oligonucleotide
having a sequence which is complementary to nucleotides 200-217 of
the 4031 by cDNA sequence; a method for determining expression of
a MACE-C1 gene using the kit; a polytope comprising at least one tumour rejection antigen derived
from MAGE-C1 or MAGE-C2 and at least one other tumour rejection
the presence of cytolytic T cells specific for complexes of a human
lenkcyte antigen. MACE-C1 and be used in a method for determining
the presence of cytolytic T cells specific for complexes of a human
lenkcyte antigen. HAGE-C1 and be used in a method for determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour rejection antigen precursors - used for determining presence of cytolytic T cells specific for complexes of a human leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1167 T;

This nucleotide sequence encodes novel human tumour rejection
This nucleotide sequence encodes novel human tumour rejection
This nucleotide sequence encodes novel human tumour rejection
antigen precursor (TRAP) MAGE-C1 (see W81546). MAGE-C1 is a novel
Cells, leading to lysis of the tumour cells which express it.
CHACE-C1 and MAGE-C2 (see W81547) are expressed in a variety of
tumours and in normal testis cells, but not by other normal cells.
The MAGE-C1 cDNA was isolated from a melanoma L8373-MEL CDNA by
CPCR amplification (see V69732-33). It shows homology to MAGE-A1
CDNA (see V69719). The MACE-C1 gene was localised to Xq26-q27.
CMACE-C1 and MAGE-C2 CDNAS (see V69726) are claimed, as are:
expression vectors; transformed or transfected cell lines (e.g. COS)
CC and CHO); an isolated TRAP encoded by the CDNAS; a kit useful in a
CPCR based assay; a method for determining expression of a MAGE-C1
gene using the Kit; a polytope comprising a number of tumour
rejection antigens derived from MAGE-C2; and a polytope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mour rejection antigen precursors - used for determining presence cytolytic T cells specific for complexes of a human leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising at least one tumour rejection antigen derived from a water-clar MAGE-Cl and at least one other tumour rejection antigen. MACE-Cl and MACE-C2 and be used in a method for determining the presence of cytolytic I cells specific for complexes of a human
                                                                                                                                                                                                                                                                                                                                                                           Tumour rejection antigen precursor MAGE-C1 cDNA.
MAGE-C1; human; tumour rejection antigen precursor; TRAP;
therapy; diagnosis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Percent Similarity: 39.00 Length: 13

This sequence encodes a monoclonal anti-hepatitis B antigen binder sequence encodes a monoclonal anti-hepatitis B antigen binder sequence from the R26 library which may be used in the conjugate of the invention. The novel labelled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The catcached to a functional surrogate of an analyte for a limiting amount of an affinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively can with the analyte for a limiting amount of its affinity acceptor. Functional surrogates are able to minic naturally occurring analytes. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunoassays) for detecting large macromolecules such as polypucties, polypuctleoting and a small haptens. Typical diagnostic analytes for detection include cardiac or tumour markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               allegens, hormones related to fertility pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, foliace stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human luteinising hormone, cytomegalovirus, chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CAL25 (a tumour marker). Sequence 99 BP: 14 A; 36 C; 28 G; 21 T;

This invention describes a novel method for identifying a nucleic acid that encodes a polypeptide which affects covalent coupling of polypeptides to the surface of Gram-positive bacteria. The method identifies mutations in bacterial factors that (in)directly interact with the LPXTG-motif dependent C-terminal anchorage of polypeptides, particularly pathogenicity factors, to the cell surface. The products of the invention have antibacterial activity and are potentially useful as therapeutic agents, inhibiting binding of bacteria to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W09916894 Seq ID 7.

The agents identified inhibit polypeptide-induced adhesion of bacteria to extracellular matrix in the host. The active agent effects the LPXTG motif-dependent anchorage of pathogenicity factors to the bacterial cell wall and are potentially useful as therapeutic agents, inhibiting binding of bacteria to extracellular matrix in the host.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 8: Page 48: 105pp; English.

The promoter (T3364) of the arabinofuranosidase gene of Aspergillus niger 3M43 was identified in a full-length gene (T33646) isolated from a genomic DNA library. The promoter is strongly repressed by glucose and induced by intermediates of xylose metabolism. It can be used to control the expression of a gene of interest, e.g. A. niger arabinofuranosidase or a heterologous gene, in a host cell, pref. Aspergillus or a transgenic plant.

Protein: and related plasmids, transformed E.coli and recombinant protein: and related plasmids, transformed E.coli and recombinant protein: and related plasmids, transformed E.coli and recombinant proteins, useful in enanticoselective prodn of L-carnitine

T proteins, useful in enanticoselective prodn of L-carnitine decombinant proteins, useful in enanticoselective prodn of L-carnatine dehydratase (CDH) gene C Claim 1; Page 17-18; 32pp; French.

The nucleotide sequence of the E.coli L-carnatine dehydratase (CDH) gene designated calB. The sequence forms part of the carnatine operon which calforned sthe accessory protein CaiE encoded by the calE gene (Q98554).

The sequences were obtained from E.coli strain 044K74 which was isolated from rat intestine. The call gene was obtained by screening an E.coli chromosomal DNA library with the probes Q98555-7, based on the N-terminal sequence derived from the purified enzyme. The 1.3 kb Mul-MulI caiB sequence derived from the purified enzyme. The 1.3 kb Mul-MulI caiB sequence derived from the microbiological prodn. of L-carnatine from cortonobetaine. L-carnatine is an essential factor in long chain fatty acid transport across internal mitochondrial membranes. It can be used to treat L-carnatine-deficiency syndromes, haemodialysis and cardiac patients and to stimulate prodn. 313 A; 310; 311 G; 261 T;

E.coli L-carnatine dehydratase gene caiB.
E.coli, L-carnatine dehydratase; caiB; carnatine operon; CaiE; rat; intestine; chromsomal DNA library; probe; expression plasmid; Bacterium; crotonobetaine; long chain fatty acid; transport; mitochondrial membrane; haemodialysis; cardiac; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-NOV-1997 (first entry)
Coding sequence for alkaline liquefying alpha-amylase.
Coding sequence for alkaline liquefying alpha-amylase; detergent;
Starch-related polysaccharide; hydrolysis; enzyme; surfactant resistance;
alpha-1,4-glucosidic link; alkalophilic Bacillus; laundry detergent;
dish.washing detergent; starch; ds.
Bacillus species KSM-AP1378.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /product= alkaline liquefying alpha-amylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length: 13

                                                                                                                                                              DNA encoding alkaline liquefying alpha-amylase - useful in dish-washing and laundry detergents for removal of starch dirts claim 8. Page 23-26. 40pp. English.

This sequence represents the coding sequence for an alkaline liquefying alpha-amylase. Alpha-amylase is an enzyme that acts on starch-related polysaccharides. Nydrolysing the alpha-14-qlucoside bond of the polysaccharide molecule. Alkaline liquefying alpha-amylases exhibit resistance to surfactants used in detergents, and decompose starch or starch-related polysaccharides in a highly random manner. The Bacillus species KSM-AP1378, from which this sequence was isolated, is an alkalophilic Bacillus strain. It was isolated from soil in the vicinity of the city of Tochigi. The enzyme is useful in improving the efficiency of dish-washing and laundry detergents, particularly on starch dirts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New equine and canine interferon - and recombinant DNA molecules coding for them, and transformed cells.

Aspergillus arabinofuranosidase - useful for degradation of arabinoxylan arabinoxylan Example; Page 52-55; 105pp; English.

Example: Page 52-55; 105pp; English.

The Aspergillus niger 3M43 arabinofuranosidase gene (T33646)

Crodes for the precursor form (W00810) of the arabinofuranosidase enzyme. It was isolated from a genomic DNA library by screening with a PCR clone obtd. by amplification of A. niger DNA using primers (see also T33644-45) based on an isolated peptide (W00806) con be used for prodn. of arabinofuranosidase (W04167) in transformed hosts, pref. Aspergillus or a transgenic plant. The promoter (see also T33641), terminator (133642) and signal sequence (T33643) may also be used to control expression of the arabinofuranosidase gene, or other gene of interest, in a host
                                                                                                                                                                                                        11-DEC-1996 (first entry)
Aspergillus arabinofuranosidase gene.

productions of the present invention describes a computer readable medium which has the present invention describes a computer readable medium which has the present invention describes a computer readable medium which has the nucleotide sequence at least 95% identical to 5EQ ID No: 1 to 391. The nucleotide sequence at least 95% identical to 5EQ ID No: 1 to 391. The nucleotide sequence at least 95% identical to 391 (V52134 to V52524) are genomic fragments from Streptococcus and 10 (V52134 to V52524) are genomic fragments from Streptococcus concerned (SEQ ID No: 1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating members or (b) isolating the nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the sequence is homologous to amplification primers derived from the isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the subject of the summary of the supplication and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the summary of the supplication and isolating the amplified system for identifying fragments of the supplied and system for identified system for identified system for identified system for ide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae. 1415 G; 2057 T; Sequence 6735 BP; 2122 A; 1141 C; 1415 G; 2057 T;

embryo 11.5 p.c1ZAP CDNA library. The invention discloses the discovery of novel protein kinases mcLKZ, mcLK3 (see W49912) an mCLK4 (see W49914, of mol.wt. 59.9, 58.5 and 57.2 kDa, respectively, as well as other novel proteins (see W49906-10) involved in cellular signal transduction, and provides vectors, host cells, purified recombinant proteins, methods for identify compounds that activate or inhibit the novel proteins, as well methods for the diagnosis and treatment of diseases associated the novel proteins. Overexpression of CLK serine/thereoine kin has been implicated in certain types of cancer. Compounds that inhibit their catalytic activity or disrupt their interactions with natural binding partners may act as anti-cancer therapeutic mcLK related molecules and compounds may also be useful as male contraceptives.  Sequence 497 AA;	U	regulate RNA splicing in cells.	cloned from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    membrane trafficking

Claim 25; Page 37; 59pp: English.

W04180-83 are novel human cellubrevins (CB-1, -2, -3 and -4). CBs

can be used for the study and regulation of vesicle trafficking in

normal, and in acute and chronic disease situations, and for the

diagnosis and treatment of conditions caused by infection, traumatic

tissue damage, hereditary disease, e.g. asthma or arthritis, invasive

cancer, leukaemia and lymphoma or other physiologic/pathologic problems

associated with induced, and otherwise abnormal, membrane trafficking.

In particular, the CB-4 polynucleotide (isolated from a cerebellum

library (CRBLNOYCI) can be used in a diagnostic test for conditions or

diseases in which its expression is induced, e.g. cerebellar degenerative

diseases or brain tumours, while CB-4 inhibitors can be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N-PSDB; T59908.

Purified RNA polymerase II holo:enzyme - comprises RNA polymerase II and one or more regulatory proteins, pref. suppressor of RNA polymerase B proteins or SNI/SNF proteins
Claim 11; Fig 10a-b; 154pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated human cellubrevin polynucleotide(s) - useful to develop prods. for diagnosis and treatment of conditions involving abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               claim 8; column 137-140; 84pp; English.

Wi7676-W7677 represent ankyrin proteins isolated from the helminth parasites Dirofilaria immitis and Brugia malayi. The nucleic acids and recombinant products are useful for the nucleic and sa vaccines against parasitic helminth, e.g. D. immitis or B. malayi. They can also be used for therapy after infection, and to raise antibodies, also for use in therapeutics, as passive immunogens, or as therapeutics against helminths on conjugation to cytotoxic agents. The nucleic acids contained in viruses, may also be used as viral vaccines, and the nucleic acids themselves or in vectors may be used as genetic vaccines.
Novel yeast SRB (suppressor of RNA polymerase B) proteins SRB4, SRB5, SRB6, SRB7, SRB8, SRB10 and SRB11 (W13821-28) are transcription regulatory factors that act as positive and negative regulators of RNA polymerase II activity, and are components of the RNA polymerase II holoenzyme. They were identified using methods designed to identify transcription factors involved in RNA polymerase II ctranscription factors involved in RNA polymerase II ctranscription factors involved in RNA polymerase II STBS can be used to treat diseases resulting from alteration or deletion of the SRB gene, pref. by gene transfer technology. They come also be used in in vitro transcription of DNA and to identify sequence 1226 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence represents a Brugia malayi ankyrin protein. The ankyrin protein, or anti-ankyrin antibodies, may be used to protect an animal from disease caused by a parasitic helminth, especially where the disease is heartworm disease, elephantiasis or

protection of animals from disease caused by parasitic helminth claim 5; Columns 79-82; 84pp; English.

The present sequence represents part of a Dirofilaria immitis ankyrin protein. The ankyrin protein, or anti-ankyrin antibodies, may be used to protect an animal from disease caused by a parasitic helminth, especially where the disease is heartworm disease, elephantiasis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Production of para-hydroxybenzoate - using pobA(-) Pseudomonas
strains which have a toluene degradation pathway and do not produce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pseudomonas mendocina para-hydroxybenzoate hydroxylase.
Para-hydroxybenzoate hydroxylase; para-hydroxybenzoic acid; PHBA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; Page 39-41; 60pp; English.

This is the amino acid sequence of a Pseudomonas mendocina para-hydroxybenzoate hydroxylase (PHBH). P. mendocina possesses two highly homologous pobA genes (see V84270-71), both of which encode PHBH enzymes (see W86281-82) able to convert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 34; DB 1; Length 303;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note of a cids encoding ankyrins from helminth parasites - useful for recombinant production of the proteins for use as vaccines and recombinant production of the proteins for use as vaccines and recombinant production of the proteins.

Treatments against helminth infection
Claim 8: Column 79-82; 84pp: English.

W76769-W7677 represent ankyrin proteins isolated from the helminth parasites birofilaria immitis and Brugia malayi. The nucleic acids and recombinant products are useful for the recombinant production of the ankyrin polypeptides. These proteins can then be used as vaccines against parasitic helminth, e.g. D. immitis or B. malayi. They can also be used for therapy after infection, and to raise antibodies, also for use in the rapeutics, as passive immunogens, or as therapeutics against helminths or curuses, may also be used as viral vaccines, and the nucleic acids contained in themselves or in vectors may be used as genetic vaccines.
                                                                                                                                                                                                                                                                New modified peptide(s) - obtained by substitution with an amino acid which is modifiable by a reaction and replacing other amino acid which is modifiable by a reaction and replacing other amino acids which are not to be modified

Claim 7; Page 22; 33pp; English.

The peptides w77376-W77390 can be modified by the method of the cinvention by substituting at least one amino acid which is modifiable by a reaction and replacing other amino acids in the peptide with amino acids which are not modifiable by the reaction. The methods can be used for the modification of biologically active peptides such as hormones, drugs, toxins and peptides which act on lipid bilayer membranes. The modified peptides can be used e.g. in the body of an animal or plant or parts in corder to affect the structure or integrity or permeability of a foreign body such as a microorganism, parasite or virus present in the body of the animal or plant or within the cells of the body of the animal or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

PA Nocleic acids encoding ankyrins from helminth parasites - useful for recombinant production of the proteins isolated from the helminth are combinant products are useful for the recombinant products are useful for the recombinant production of the crombinant products are useful for the recombinant production of the arkyrin polypeptides. These proteins can then be used as vaccines against parasitic helminth, e.g. D. immitis or B. malayi. They can also be used for therapy after infection, and to raise antibodies, also for use in therapeutics, as passive immunogens, or as therapeutics against helminths on conjugation to cytotoxic agents. The nucleic acids contained in viruses, may also be used as viral vaccines, and the nucleic acids of themselves or in vectors may be used as genetic vaccines.
                                                                   15-JAN-1999 (first entry)
D. immitis ankyrin pDIAnk1745 protein.
Ankyrin; helminth; parasite; vaccine; therapy; infection; passive immunogen; cytotoxic agent.
Dirofilaria immitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful as antigenic protein for vaccine

Sisclosure: Fig 1: 13pp; English.

CDNA was prepd. from FIPV straim 79-1146. N81533 gives the sequence

of the peplomeric gene in three reading frames. The top reading

frame is an open reading frame of 4356 nucleotides and has a coding

capacity for a precursor polypeptide having a mol. Wt. of 160.470

(1452 AAs). The beginning and the end of the E2 gene are indicated

in the FT of N81533. The first 18 N-terminal AAs have a strong

hydrophobic character and presumably comprises a cleavable signal

ceptide. The extreme carboxy-terminal part comprises a region of 20

hydrophobic AAs, which presumably serves as a transmembrane anchor.

The FIPV peplomeric protein has 35 potential glycosylation sites,

of which 22 are in the N-terminal part (poss 1-790) which corresponds

to the S-part of the IBV E2 (see P81183). N.B. IBV = infectious

bronchitis virus. "X" in the AA sequence denotes the translation
para-hydroxybenzoic acid (PHBA) to protocatechuate. A claimed method for the production of PHBA comprises: (a) culturing a pobA(-) Pseudomonas strain in a medium containing an aromatic organic substrate (e.g. toluene or p-cresol), at least one C-source (e.g. qlucose or succinate) and an N-source, where the pobA(-) Pseudomonas strain comprises pobA genes encoding the toluene monoxygenase toluene degradation pathway and where the pobA(-) Pseudomonas strain does not produce any detectable PHBH activity config to pobA gene distruption, so that PHBA accounliates at a rate of about 0.01-1 g PHBA/G.cell.hr; and (b) recovering the PHBA. The PHBA is used as a monomer for liquid crystal polymers. Esters of PHBA and also be used as backbone modifiers in condensation polymers, e.g. polyesters, and are also used to make paraben
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29-OCT-1992 (first entry)

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75.84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) Sequence 20 AA;
                                                                                                                                                                                                                             HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).

Sequence 12, Application US/08218265
Patent No. 592288
GENERAL INFORMATION
APPLICANT: Young, Richard A.
APPLICANT: Thompson, Craig M.
TITLE OF INVENTION: No. 5922585el Factors Which Modify Gene
TITLE OF INVENTION: Transcription and Methods of Use Thereof
NUMBER OF SEQUENCES: 35
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.
STREET: Two Militia Drive
CITY: Lexington
STATE: MA
COUNTRY: US
COUNTRY: US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 2; Length 1226; 90;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
US-09-031-485-72
Sequence 72, Application US/09031485
Sequence 72, Application US/09031485
Patent No. 5824306
GENERAL INFORMATION:
APPLICANT: Tang, Liang
APPLICANT: Blehm, E. Scot
TITLE OF INVENTION: DIROFILARIA AND BRUGIA ANKYRIN
TITLE OF INVENTION: PROTEINS, NUCLEIC ACID MOLECULES, AND
TITLE OF INVENTION: USES THEREOF
TITLE OF INVENTION: USES THEREOF
                                                                                                                                                                                                                                                                                                                                                                                                                                     APPLICANT: Tang, Liang

MISCELLANEOUS: ON THE BASIS OF IMMUNOLOGICAL AND KINETICS DATA,

MISCELLANEOUS: ON THE BASIS OF IMMUNOLOGICAL AND KINETICS DATA,

GST 5.7 IS DISTINCT FROM ALPHA, MU AND PI CLASSES OF GTS. HOWEVER

IT HAS BEEN POSTULATED THAT THIS PROTEIN MAY BE PART OF A DISTINCT
SUBGROUP WITHIN THIS ALPHA CLASS.

MISCELLANEOUS: THE VARIATIONS WERE FOUND FROM AA SEQUENCING AND

IMPLY THERE ARE MULTIPLE FORMS OF THIS PROTEIN. THESE VARIATIONS

ARE LIKELY TO BE SEX-LINKED AND TISSUE SPECIFIC.

SIMILARITY: BELONGS TO THE GST SUPERFAMILY. ALPHA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                      TISSUE-LUNG;
